

Experience in the diagnosis and treatment of hair loss and alopecia

T.V. Akaeva

(LLC Center for Homeopathic Medicine "Life Force", Moscow, Russia)

Of the total number of patients examined during the year with the main complaint of hair loss, 7 people came to me.

During the diagnostic examination of patients with hair loss and alopecia by the ART + method:

- in all cases, a causal relationship was found with dyskinesia of the gallbladder, intestinal dysbiosis, psychovegetative stress, lack of minerals and trace elements;
- in 2 cases, the presence of trichophyton rubrum was found;
- in 3 cases - burdening with helminths.

The patients underwent complex treatment according to a single scheme:

- selection and appointment of a drainage preparation of the company "ONOM";
- manufacture and purpose aimed (according to the list of organopreparations, viruses and bacteria identified during testing) autonosode the patient's blood;
- selection and appointment of systemic spiritual adapters for the removal of psycho-vegetative and psychological problems of the patient;
- selection and prescription of "Medfarma" preparations, "hair" group (hair root, alopecia, hormones, Huxley layer, etc.);
- in the presence of helminths, treatment with Metosept 3 courses for 1 month (a break between monthly courses for 7 days);
- a course of sorbents (polyphapan or enterodesis) for 10 days;
- probiotics, nutritional recommendations are given;
- vitamins of group A and E;
- 3 weeks after the start of treatment, in addition, all patients underwent mesotherapy of the scalp area with the OTI preparation "zona cutanea pilo-sebacea" subcutaneously 3 to 5 times 1-2 times a week.

In addition, in 5 cases, an inverse recording of discharge (crust or suppuration) from the scalp was made.

At week 4, all patients noted improvement: no hair loss on the pillow after a night's sleep, after washing the hair.

After 2 months, in cases with alopecia areata (5 cases), the patients had hair regrowth.

In the rest, treatment lasted from 3 to 6 months with positive results.

Conclusions:

1. Using the hardware and software complex "IMEDIS-EXPERT" as the basic technical support of the doctor of the ART + method as the basic method of examining the patient, complex energy-informational therapy as a method of treatment allows:
2. Effectively, from the point of view of subsequent therapy, conduct differential diagnosis of the causes of alopecia.
3. Conduct effective treatment and recovery

the patient's scalp in a fairly short time.

4. Using targeted autonosode blood of a patient with alopecia is an important component of his therapy, which makes it possible to effectively eliminate infections or injuries in the tissues, organs and systems of his body interested in this disease.
