

An alternative approach to solving the problem of dermatoses of various origins
Sibireva I.I.
(Clinic of oriental and restorative medicine "Teida", Ivanovo,
Russia)

Solving the problems of remission and treatment of dermatoses of various origins, our team has worked out and optimized an algorithm that harmoniously combines the achievements of bioresonance medicine and thousands of years of experience in health medicine of Slavic and Eastern peoples.

The staff of the Teida clinic has examined and monitored 372 patients with various forms and degrees of dermatological diseases in the age categories from 12 to 66 years for several years. These are acute and subacute dermatitis (including allergic) - 47%, neurodermatitis - 18%, acne - 25%, eczema, psoriasis, vitiligo, etc. - 10%.

These patients were found to have concomitant pathology:

- habitual constipation and irritable bowel syndrome - 62%;
- lipid metabolism disorders, constitutional or diencephalic obesity - 12%;
- chronic stress, chronic fatigue syndrome, depressive states (mainly, these are banking employees and executives) - 71%;
- chronic and sluggish diseases of the gastrointestinal tract (chronic gastritis, biliary dyskinesia, chronic pancreatoduodenitis, dysbacteriosis, 3 cases of ulcerative colitis, etc.) - 65%;
- functional pathology of the nervous system - 68%;
- vegetative-vascular dystonia of various origins and pathology of the cardiovascular system (myocardial dystrophy, cardiopathy, etc.) - 19%.

All patients underwent a comprehensive diagnostic examination using a vegetative resonance test (ART), where endogenous and exogenous damaging factors were identified and corrected (geopathogenic loads, electromagnetic and radioactive burdens, immune and meridian changes, overt and latent allergic reactions, imbalance of microflora, parasitic burdens, etc.).

In the study of the consistency of the functions of the skin and their deviation from the normals, it was revealed that in 100% of cases, its excretory and immune functions are affected.

Along with a change in the functions of the skin, there was a tendency to a change in the functions of other excretory structures: the intestine, hepatobiliary system, urinary, respiratory in varying degrees. In the study of patients, attention was paid to deep psychological motives projected onto the skin: denial of one's own strength, inability to live for oneself, suppression of feelings, anger driven inward, resistance to everything, lack of emotional protection, confidence in the need for punishment, fear of making a wrong decision, secret fears, confusion about the future, fear of resentment, refusal to take responsibility for their feelings, etc. etc.

The therapeutic integrated approach, worked out by the team of the clinic, consisted of the following:

- 1) Courses of BR-therapy, nosodotherapy, correction of cortical rhythms, correction meridian structures, inversion of problem areas, use of donor frequencies.
- 2) Work with oriental techniques: classic and fast acupuncture, tszyu-therapy, wam-boo-liao-therapy, yu-mei-ho-therapy and other author's techniques.
- 3) The course of cleansing therapy: from 3 to 9 procedures of hydrocolonotherapy with implantation of living active young flora and phytopreparations, from 1 to 4 procedures for cleansing the liver and bile ducts according to the method of the St.

elements of multiresonance therapy - color, chromium, aroma, vibration, music therapy, ionized air, a system of fine hydrofusion and activation of cutaneous and subcutaneous blood flow and other water programs (including exposure to silicon, silver, baptismal water).

4) A course of natural therapy using leech-based products secret, lithotherapy, mineral therapy, aromatherapy, etc.

5) As a final stage - individual food rehabilitation with correction of the immune system by eliminating intolerable and toxic foods from the diet.

6) Stage control of the course of treatment with a vegetative resonance test and remote computer thermography.

We considered a necessary condition for the patients to strictly follow the prescribed optimal complex course with; adherence to recommendations for adequate nutrition and elimination of addictive habits.

The duration of corrective courses ranged from 2 weeks to 2 months, sometimes with repetitions after 3 months, depending on the stage and form of the pathological process and the individual ability to restore the growth layer of the skin and innervation of problem areas.

98% of the examined and methodically treated patients completed the course of treatment with a positive subjective and objective result. Itching, allergic rashes and acne disappeared, the integrity and trophism of the skin and pigments was restored with the restoration of skin functions, in cases of psoriasis and eczema, a stable remission was achieved, exogenous and endogenous risk factors were eliminated.

Along with the correction of the underlying dermatological disease, an important factor is the positive effects in the treatment of concomitant pathologies. This is the normalization of the gastrointestinal tract with the restoration of microflora, parietal absorption and parietal digestion in 97% of cases, elimination of the phenomena of bile stagnation in 89% of cases, harmonization of the excretory system and kidneys in 74% of cases, reduction of vegetative-vascular phenomena and normalization of blood pressure and pulse rate in 68% of cases, a clear improvement in the psychoemotional state of all patients with a negative test for depression and stress, irritability, phobic states, etc., which, accordingly, stimulates cellular and

organ immune programs. It should be noted that during the complex treatment, patients did not use medication. For all others who follow the course of recovery, planned monitoring of those interested in immunological status of the systems and organs by the method of vegetative resonance test after 1 program,- 2-3 months with the dynamics of recovery

Complex dermatological pathologies, which have a lot of concomitant diseases, which are difficult to give in, and sometimes not at all amenable to traditional methods of treatment, are successfully corrected with persistent remission, social, psychological, natural and physical rehabilitation combined methods, enriched the newest medical diagnostic and therapeutic bioresonance technologies.
