

Application of the vegetative resonance test "IMEDIS-TEST +"
in diagnosis and treatment
Vitrik L.A.
(Moscow, Russia)

I have been working on the apparatus of APK "IMEDIS-FALL" since 1997, and I began to use the vegetative resonance test "IMEDIS-TEST +" only since June 2003.

I would like to note that the diagnostics have become more accurate. Often, mental, geopathogenic and radioactive influences can be seen at Levels 2 and 3, while at Level 1 they are not tested.

With the introduction to the contour Ferrum met. D60 filters insignificant at Levels 1-4 readings and tests dominant ones. The number of primary affected organs, dominant foci and their pathogens decreases, which makes it possible to more accurately determine the causes of problems in patients.

I present for consideration the cases of diagnosis and treatment using the MINI-EXPERT-D apparatus.

1. Patient S., born in 1957. Has filed complaints about recurring pains in the right mammary gland and right armpit, in the lumbosacral region, pain along the veins of the left leg. Anamnesis: urolithiasis, pneumonia and childhood infectious diseases. Rehabilitation of foci of infection in the head area, correction of the endocrine system, and drainage were carried out. With the help of the ART + method, viruses were detected at Level 3: herpes simplex 1, 2, mumps and Dengue fever.

Specialists appointed Vipera, Resoplexes, frequency preparations for pathogens and metabolism.

Ultrasound scan in January 2004: there are no calculi in the kidneys. The pain in the lumbar region stopped, the mammary glands were painless on palpation, menses regularly without premenstrual syndrome.

2. Patient N., born in 1959. Disturbed by pain in the left hypochondrium, overweight.

Anamnesis: ultrasound revealed uterine fibroids and polycystic ovaries. The diagnosis revealed endogenous depression at Level 2, and at Levels 1-3 benign tumors were tested along the TC, Yar, E, skin and fatty degeneration meridians. A preparation was made along the line of Life - inverse engrams along the entire line, including the points of Birth and Conception. The target marker was the Conium D30. After a few days, an itchy rash appeared on the head. Pain in the left hypochondrium practically does not bother. Level 3 detected: Epstein-Barr viruses, herpes simplex 1, 2, adenoviruses; tested nosodes: D26 nephrosis, D26 kidney stones. The treatment continues.

3. Patient K., born in 1982. Worried about hair loss head, loss of vision, irregular menses. History: cholecystectomy, yersineosis.

At Levels 2-3, induction programs are tested: children's program, cerebral program, stress III. Level 3 is tested

cytomegalovirus on the meridians of ND, MS, EPD, TC, Kr, K, UV, V. At the next visit at Level 3, the Coxsackie B virus, type 1, 4 is tested. Prescribed drugs: Spec. drug Ubiquinone, Spec. drug Vipera, drugs of the Endocrinotox group. The treatment continues.

4. Patient K., born in 1995. Complaints about frequent colds diseases, cough, bronchospasm. Anamnesis: from birth increased intracranial pressure, biliary dyskinesia, sometimes red blood cells in the urine. Diagnostics showed: Level 2 - the maximum burden of head foci (sinuses), the effect of amalgam on the kidneys, nosode Nephrosis D32. At Level 3, measles, rubella, mumps, and adenoviruses are tested.

Prescribed drugs for the rehabilitation of head foci, nosode Nephrosis D32, Special preparation Naja, drains. On a second visit, he notes that there were rashes on the face, profuse discharge of mucus from the nose and bronchi. It has been observed since October 2003, and during this time there were no bronchospasms. The treatment continues.

5. Patient V., born in 1954. Left hip fracture postoperative anemia. Blood test: erythrocytes - $2.6 \cdot 10^{12}/l$, hemoglobin - 85 g / l., ESR - 40 mm / hour.

Diagnosis revealed nosodes at Level 2 Nephrosis D26, deficiency Erythropoietin. Therapy with the frequencies of Erythropoietin in the kidneys for stimulation was carried out, the nosode Nephrosis D26 was given, the kidneys were BRT along the meridian performed.

A month later, in the blood test: erythrocytes - $4.29 \cdot 10^{12}/l$, hemoglobin - 138 g / l, ESR - 6 mm / h. Frequency therapy for bone fusion is performed.

Conclusions:

1. During this short period of work with the device "MINI-EXPERT-DT" using the ART method "IMEDIS-TEST +" I found that external influences are more often tested at Levels 2 and 3. Benign tumors, cystic processes are not detected at Level 1, but are diagnosed at Level 3. This is very important in terms of preventive treatment.

2. FI and BI are different at different levels and it is better to focus on Levels 2 and 3.

3. At Level 3, they are more often filtered through Ferrum met. D60 viruses and effectively work Special. Vipera and other drugs with poisons that resonate with the cell nucleus.

4. In terms of preventive treatment of severe degenerative diseases, chronosemantic diagnostics and therapy can be used.

5. Treatment of pathogens at 3-4 Levels is always necessary accompany with good drainage preparations, abundant drinking of plain clean water, if possible, water procedures and preparations to maintain the immune system.
