

True and imaginary goals of diagnostic search in progress  
vegetative testing

A.V. Trifonov

(International Foundation "Help Yourself", Moscow, Russia)

The unity of the diversity of life forms, apparently, is one of the main conditions for the possibility of existence and reproduction of the very phenomenon of life, as one of the forms of existence of matter. On the planet Earth, the number of life forms, the variety of design and dimensions, probably still the value is finite relative to the past and present time and, possibly, infinite, relative to the future. The disappeared and disappearing forms and types of life on the one hand, and the emergence of new forms of life, especially in the microworld, recorded by paleontologists and biologists, the emergence of the possibility of human creation of transgenic organisms, on the other hand, indicate a simple truth - life is both finite in particulars and endless generally. For emergence, existence, the disappearance of specific organisms and their communities requires specific changes in the energy-informational continuum of the environment, in other words, some critical dynamic quantitative transformation of the ratio of energy, mass, speed, space and time. For the existence of the phenomenon of life in general, as one of the forms of existence of matter, these quantitative transformations of ratios do not play any role, and only create the basis for its endless existence in an endless evolutionary transformation.

The general property of the living is adaptability manifested by a quantitative transformation of the ratios of the internal environment of the organism in response to the transformation of ratios in the external environment, as long as the space-time continua and energy-informational ratios of the internal (smaller) and external (larger) volumes remain equilibrium synchronized. A simple and unambiguous conclusion follows from this - any living organism remains so as long as the balance between the internal and external environment of the organism is maintained. The stability of this equilibrium will be the greater, the fewer asynchronous subsystems (biochemical complexes, proteins, micro- and macroorganisms) appear and are present inside the organism, significantly differing in the spectra of radiation and energy absorption from the spectra of proteins. The design of proteins in each individual organism is encoded in its own DNA and is,

space). This mechanism, apparently, is universal and unified, both for the processes of aging and death, and for the phenomenon of diseases - it is just that the process of life in illness and death differ in different degrees and ratios of the deviation of the balance between the internal and the external. Moreover, the disease appears when various parts of the whole organism in relation to the dynamics of cosmogonic processes begin to move away from the point of equilibrium with different

speeds and accelerations. The bioresonance adaptive effect is primarily addressed to the internal space of the organism, returning the synchronicity between the parts of the whole, and therefore returning the original functionality, but no more than the level that corresponds to that stage of development and aging, due to the level of deviation of the whole organism from the spatial point of conception (the appearance of DNA ) of a specific organism, together with the distance from this point on the planet.

This, perhaps, indirectly confirms some of the provisions of Einstein's theory of relativity. If you return to the spatial point of conception of your own DNA, stop the movement of macrocosmic and microcosmic objects, then immortality will come, or, on the contrary, as Einstein assumed, accelerate to the speed of light (and, possibly, to even higher speeds of subnuclear particles), then the internal transformation will stop, and again immortality will come, but at the same time the body will cease to exist - it will be annihilated since the low-frequency vibrations will fade away. Perhaps part of our information and energy continuum is represented by just such components (absolute rest and, at the same time, an unimaginable speed of propagation and frequency of twisting and oscillation).

If this is so, then it becomes clear that these are our souls, emotions and thoughts that exist and arise within the EVERYTHING, never disappear and together with EVERYTHING (an infinite whole, perhaps - GOD) existing forever, infinitely creating and transforming the manifested material the world is a world of coarser, low-frequency vibrations, controlled by more "subtle", ultra-high-frequency ones. Moreover, apparently, evolution high-frequency levels of the universe determines the need for constant transformation of low-frequency "rough" vibrations and these transformations, in turn, predetermine this evolution according to the principle of direct and feedback, forming a single continuous dynamic contour in an infinite volume of space and time, each part of which is a fragment of a hologram of a larger or on a smaller scale, resonating with the whole on its unique reflection and absorption spectra, periodically merging and disconnecting with this whole, that is, periodically dying and reborn in new forms.

From the above considerations, it is possible to draw a lot of practical conclusions that allow us to look at the process of vegetative resonance testing from these positions, bearing in mind the famous philosophical statement of Helvetius, the meaning of which boils down to the understanding that knowledge of some principles frees a person from knowing a lot of facts.

From these positions I will try to substantiate some of the statements that I will express below.

The human body, like any other organism, is a haven and environment for a huge number and variety of micro- and macroorganisms from phages and viruses, bacteria and protozoa, to worms and insects, fungi and algae. All life on earth is for each other at the same time a part of the habitat, and a building material, and an energy donor.

And this is not surprising, given that up to 80% of the biomass on Earth is just

are representatives of the microworld - microalgae, viruses, bacteria, insects, fungi and worms. And larger living organisms, such as mammals, fish, birds, reptiles and reptiles on this planet are essentially guests, and even a person on Earth can be regarded as an artifact in general. If suddenly people manage to destroy themselves as a species, then organic life is unlikely to suffer from this, and may even benefit, and it certainly will not disappear, because it is based on the organic microcosm on Earth.

Microorganisms, worms, algae and protozoa appeared on Earth before mammals, which means they can be considered a part of those environmental factors that predetermined the emergence and further evolution, the complication of more highly organized, more multicomponent designs, including us with you. Accordingly, those forms of microorganisms, the natural habitat of which are our organisms, can be considered part of the optimum of the habitat, without which our biological life is generally impossible.

From these positions, the problem of infectious and parasitic burdens should be considered not in the sense of their detection and further fight against them, but in the sense of analyzing the degree of activity of one or another infectious agent, analyzing the ratio (spectrum) of various communities of microorganisms, their approximate number, preferred location and reasons that allow them to be activated inside the body to levels incompatible with the concept of a healthy life process. If in the human body there are no asynchronous (inherent in the absorption and emission spectra of microorganisms) vibrational resonators, then for microorganisms there will be no corresponding resonance levels, respectively, the body itself will not allow their dangerous activation. Based on what was said,

Failure to understand these simple truths when testing infectious and parasitic burdens leads to absurdity and complete discrediting of this method in the eyes of patients and thinking doctors.

We must take as a basis that within us there is always a huge variety of microorganisms, and this can be considered a blessing. It is not their presence that decides everything, but the ratio of their degrees of activity, which is determined precisely by the macroorganism, the degree of synchronization of the internal space macroorganism, or the degree of deviation from harmonious synchronization in one or another part of the macroorganism, which creates a niche for the activation of a specific form of microorganisms.

When testing, only those resonances of frequencies of microorganisms are important that correspond to the equivalents of decimal and, in some cases, hundredths of homeopathic dilutions (from feta to D1–36 for bacteria and worms and from feta to D400–600 for viruses). These levels correspond to a state of the body in which most often the possibility of self-healing is absent or blocked, and the quality of life reflects the presence of either subcompensated or exacerbated chronic disease.

In this case, first of all, we must try to find a specific type of mismatch in the functional interaction of body systems, understand the variant of the causal chain underlying

activation of microorganisms, and try to restore balance in the body (especially with the help of endogenous bioresonance therapy, physiological cleansing of the body from homotoxins, nonspecific activation of the biochemical conveyor by dietary supplements and, naturally, parallel exogenous induction effects, frequency antiparasitic and antimicrobial and other programs that cause phase or antiphase resonance directly with these microsystems in order to suppress their activity, or resonant destruction of most of them. long-lived biochemical complexes of the body, which is unacceptable and can lead, in my opinion, to big problems.

Recently, when several centers appeared in Moscow where IMEDIS equipment is used, and patients periodically began to appear at my appointment, who had already been diagnosed by Foll and autonomic resonance test somewhere or diagnosed and tested on devices of the Oberon series. ". Getting acquainted with the protocols of the conducted research, sometimes you are horrified. Grief - doctors sometimes test up to hundreds of different viral, bacterial and parasitic burdens, driving patients into a stressful state, essentially zombifying them, often with the aim of "extorting" money. Many, both doctors and patients, sincerely believe that such serious diseases as cancer, asthma, systemic lesions and many other complex ailments are caused precisely by these aggravations, and as soon as they are kicked out, the disease will stop.

Microorganisms and parasites of a person can certainly in some cases cause specific manifestations, sometimes even tragic, exotic, but in general, more often than not, they only aggravate and complicate the functional imbalance in the body, acting as a catalyst for a chronic ailment, which, in essence, is the basis for why the body allows their excessive growth and activation.

When cause and effect are reversed, the result is obvious. According to the WHO, 60% of the world's population carry from one to several types of parasites, and all their lives, often unaware of it, since many of them feel quite healthy. According to serious scientific research, up to 97% of the world's population is home to persistent viruses (herpes, rubella, etc.), coccal bacteria (staphylococcus, etc.) always live on the skin and mucous membranes of all people, in hair, eyebrows and eyelashes all their lives up to 160 species of mites live, on the skin of soles from the neonatal period, 100% of the population has spores of almost all types of fungal diseases of nails and skin.

The latest scientific evidence indicates the dangers of clean rooms - where there is no dust, mites, bacteria, etc., the immune system will weaken.

Thus, the general task that must be sought to be solved when

working with a patient, there should be the task of integral restoration, first of all, of the internal balance of synchronization of the wave space of the organism, then - synchronization of the whole organism with external rhythms and restoration of balance at the psychoemotional level and the level of the subjective goal-setting process.

When testing parasites, fungi, bacteria and viruses, there is no need to try to identify and destroy everyone. It is important to single out the significant leading for the main syndrome burdening complex and, if possible, remove them, or compensate, transferring them to the energy-informational niche, in which the pathological activity of the microsystem becomes unlikely.

In my opinion, trying to "make a patient happy" by sterilizing both explicit and imaginary burdens is harmful and utopian. Problems should be solved as they come, acting in a complex, but not on all conceivable and inconceivable factors, but only on the leading, clearly manifested, excessively activated, key ones.
