

An example of the treatment of skin diseases (Case from practice)

N.V. Yatsenko

(LLC "Center for Energy Information Medicine", Samara, Russia)

A 22-year-old female patient came to the Center on December 20, 2005 with complaints of blistering rashes on the hand, longitudinal cracks on the fingers, dryness and itching of the skin, red spots with a delineated rim, pale in the center on the back of the hand. A history of neurodermatitis since puberty, vain attempts to identify the cause and achieve a stable remission in traditional medicine. The patient has a hereditary burden - the mother suffers from hay fever, which has turned into bronchial asthma.

After computer diagnostics by the method of vegetative resonance test "IMEDIS-TEST" revealed: toxoplasma in the ovaries, giardia lamblia in the gallbladder, enterobius vermicularis eggs.

Dermatitis has a causal relationship with biliary dyskinesia, enzymatic insufficiency of the pancreas, psychovegetative stress, dysbiosis of the small intestine (predominance of fecal Streptococcus enterococcus and a complex of aerobic bacteria and Escherichia coli), yeast burden (saccharomyces cerevisie, geotrichum candidum), vitamin A and E deficiency.

Therapy was performed:

- a course of therapy with fixed frequencies for the identified pathogens, while the patient noted that the spots turn pale during the session;
- a course of bioresonance therapy (creation of a general BR-drug, selected through the optimal step of therapy);
- treatment with drainage preparations of the company "OHOM";
- a course of cleansing enemas;
- individually selected diet;
- acupuncture course;
- induction program "Stress".

After 10 days, at the control admission, an exacerbation of skin manifestations, an increase in the size of spots and the depth of cracks, bubble rashes in the interdigital spaces were observed.

At the reception, therapy was carried out:

- a session of multiresonant therapy with inversion of the herpes simplex virus type I and the drug "antiviral" company "IMEDIS" in the load;
- prescribed nosodotherapy with "Heel" preparations - Psoriasis-Nosodforte Comp., Sulfur-Hel Comp;
- A BPS-preparation was created with unloading on the meridian of the small intestine and the meridian of the spleen and pancreas.

After a few days, the patient noted an increase in the rash and the intensity of the color of the spots, then they disappeared in the order in which they were poured out.

Currently, the patient notes a significant improvement in well-being, the skin is cleansed, the itching has disappeared. To achieve the best result, the course of therapy continues.
