If we consider a person as an antenna with a multiple phased array, then the function of the human brain then is to synchronize the frequencies / fields and rhythms of all elements included in this system, and the redistribution of synchronized frequencies / fields through the body systems, respectively, turns on or off in certain processes.

A healthy organism is a harmonious system in which each process or event in each period of time has its own correct synchronized frequency-phased image or rhythm. And the brain, along with its control and monitoring systems, sets at a given specific time moment one or another frequency necessary for the body, reproducing it from carriers known to it.

Media can be conventionally divided into levels:

1. Hereditary - transmitted through chromosomes;
2. Acquired - reproduced from independently created, own synchronized frequency-phased formed images and reactions to them.

This work, perhaps, is somewhat reminiscent of the operation of a tape recorder: a bad or deliberately damaged recording can easily disrupt any orderly reproduction. This also happens with the body, when, having lost for some reason at some point from the correct frequency, it reproduces the wrong frequency (for example, desynchronized in time), and as a result, a failure occurs in the system or organ, which entails violations the functioning of this organ or system. Consequently, an incorrectly passed command or a loop leads to an incorrect execution result.

Information about the wrong result enters the brain, and if the brain notices this, then it tries to correct the error by all methods available at a given time, including reproducing information taken from the already known aforementioned carriers. This process is similar to tuning a musical instrument to a tuning fork. Most of this work is done by the brain during sleep.

The period when the consciousness is switched off, that is, sleep, is necessary to launch a special program and conduct a more complete and thorough check of possible false notes (fields, frequencies), and if necessary - their reconfiguration and rewriting taking into account the time interval. In this case, the brain rechecks not only the past reproduced "records", but also looks at future "records" (day, week, etc.) for possible damage (errors). The result of this work is transmitted into consciousness in the form of images known as dreams.

If, for some reason, the brain does not notice the "false" frequency, then the work (sound) of the whole organism (orchestra) turns out to be incorrect, leading after some time to a breakdown of the general "sound".

At the moment when this happens, it is necessary to help the body in

recognition of inconsistencies and errors of reproduction and transfer to it the set of synchronized and phased electromagnetic frequencies necessary for recovery. Humanity in its practice has accumulated quite a lot of experience for this, including chemicals and drugs, physical exercises, reflexology, spiritual and concession rituals, interior therapy®, holidays, shamanism, magic and much more, including homeopathy. And in connection with this, we can consider the homeopathic repertory as a library of synchronized and phased frequencies necessary for the body.
