

Fertility issues - an outside perspective  
V.A. Galuzinsky  
(PKK "Consilium", Astana, Kazakhstan)

During 2004-2005, in the course of a therapeutic appointment, 14 women were hired for infertility supervision on their initiative, due to the ineffectiveness of treatment by gynecologists. In 4 of them in the analysis, unilateral salpingectomy for purulent salpingitis of gonorrheal-chlamydia etiology. Eight - primary infertility, married from one and a half to four years. And two have secondary infertility from two to ten years. In the group of patients after unilateral salpingectomy, there was only one woman with secondary infertility.

Simultaneously with her husband, four women were treated, the rest of them did not succeed in attracting their husband to treatment, for various reasons.

During the survey, it turned out that the main "reasons" for the loss of fertility

were: chlamydiasis, gonorrhea, toxoplasmosis and a combination of genital herpes with candidiasis (usually candida stellatoidea, mucor ramosus, mucor mucedo with (+) resonance on the endometrium and ovaries).

In the practice of outpatient reception, the capabilities of R. Voll were used, the ranked algorithm homeopathic remedies, N.L. Lupicheva "female infertility" ("Electropuncture diagnostics ..." 1990) taking into account measurements VC 4, RP 4, D and S, F 3, R 13, R 6, MC 6 and F 11, elimination of viral-bacterial-candidiasis associate in combination with the use of resonant frequency F-programs "IMEDIS"; appointed 4-6 days before the expected menses, since the best drainage cannot be invented or modeled.

What are the results? Ten pregnancies, of which eight ended in the birth of healthy babies and two are now carrying without complications.

But not everything went so smoothly. One of the women with an infantile uterus and a history of repeated spontaneous abortions developed symptoms of threatened abortion in the third month of pregnancy, and she refused further supervision.

#### Clinical examples

1. V.G.G. 1979, with primary infertility, married for 4 years, on ultrasound polycystic ovaries with amenorrhea for 3-4 months, with chlamydia endometritis, hydrometrorrhagia, combined candidal herpetic infection with (+) resonance on the ovaries and ovarian cysts, pregnancy occurred against the background of amenorrhea. Moreover, it was taken for supervision on 01/12/2004, and a positive test for placental gonadotropin appeared on 02/26/04! So unexpectedly that I had to double-check it in the antenatal clinic. Pregnancy proceeded without complications, gave birth to a boy. In this case, the husband was treated for chlamydiasis. In the treatment, additional frequencies were used "infertility" 4.0 + 4.9 + 9.4 + 5.5 Hz, restoration of tubal patency 8.5 Hz, ovaries - 2.6 Hz and germinal vesicle 5.7 Hz, in amplitude and in time by resonance.

2.R.E.S. Born in 1982 taken for treatment on 14.12.04 for epilepsy with

twelve years of age. The first seizure occurred on TV during the message and death of V. Listyev. By April 1, 2005, there were no more epileptic seizures, and she expressed a desire to experience the happiness of motherhood. Assigned Sylfur D600 and Holly: "I am filled with love and strength." Married for a year and a half. Got pregnant 12/8/05 reported that a cesarean section was performed (due to the fear of obstetricians that an epileptic seizure may appear during the period of labor). A healthy boy was born.

3. Sh.I.G. Born in 1972 applied on 13.08.04 regarding primary infertility. Staphysagria, Terebintina were appointed. At the reception, a single dose of Psorinum 200 CH. Pregnancy began, however, on February 17, 2005, symptoms of a threat of termination of pregnancy appeared in the form of a "daub" and pain. At the reception, I took a dose of Sabina and a dose of Millefolium oil D12 with supportive therapy on an outpatient basis, under the supervision of a "women's clinic". The symptoms were reduced by the evening of the same day. In the future, the pregnancy proceeded without complications. Gave birth.

4. M.O.A. Born in 1981 married for a year and three months, applied on 17.02.05 to about infertility, uncontrolled nervousness and progressive enlargement of the thyroid gland, which began after a powerful solar flare in 2004. Morphology of the gland according to the cassette: "diffuse goiter", the Epstein-Barr virus was determined. I have a record of solar flares from 2003-2004. It was interesting, and for good reason. The activity of the Epstein-Barr virus was potentiated by the frequency of the solar flare in the D4 dilution by transfer! The record is transferred to (i), carried out a resonant frequency viral infection. Cantharis, Argentum nitricum and Arsen jod have been assigned. Control ultrasound: "diffuse goiter with nodules up to 5 mm." Aurum jod was prescribed and a resonance-private study was carried out twice for the Epstein-Barr virus, after which the clinical symptoms of hyperthyroidism disappeared and the woman became pregnant on February 1, 2006.

The question arises - what are we facing? It is a shame to talk about the incompetence of colleagues and the insufficient laboratory and instrumental support of the obstetric service. Compared to even the seventies, the state of affairs has clearly improved, in the traditional sense. Centers "Family and Marriage" have been created, genetic counseling has been introduced.

Infections, to which we now pay so much attention, are also not something new: Lord Rama faced the consequences of the "sexual revolution", and homeopathic therapy for chlamydiasis was described in the treatment of the "Egyptian disease" in the late 19th - early 20th centuries. Yes, there were many complications from them, but the women became pregnant!

The answer is viewed after reviewing the WHO statistics. There are two indisputable facts. Fact one. The curve of sperm count in 1 ml since the beginning of their counting in 1904-6, in aggregate across continental countries, has dropped from 16,000 to 4-3,500 per ml, at the present time. And with an amount of 2000 in 1 ml, the fertility function is traditionally not feasible. This is confirmed by the fact that now every 25th child is born with the help of medical technology.

The second fact. Against the background of the foregoing, there is an undeniable increase in the population of the planet. Do these facts contradict each other or are they a manifestation of the dialectic of a single process? So far, it is clear that in the zone from 4 to 2000 spermatozoa in 1 ml, eliminating "everything that interferes in practice" with the help of

advanced therapeutic technologies, we can report something else to each other.

Let's try simulate situation and realize it. Divide an imaginary curve into 3 segments. The well-known recession was preceded by a period of stability, and it was preceded by a period of emergence and rise to stability. Place the curve above the ordinate. The area between the curve and the ordinate describes the number of births on the planet. Below the ordinate, we get the mirror-symmetric curve of the "dead in Bose". Naturally, the area between the curve and the ordinate is the amount of DNA of men and women, realized in the offspring, as carriers of the function of consciousness. The latter are members of the tuples of family, ethnic and racial, filling the area of the curve horizontally to the right, they form an attractor. Moreover, each step of the attraction in the face of the cortege sometimes flashes in time above the ordinate, then goes out under it, which makes the figure of Civilization, from the point of view of an outside observer, looks like a pulsating soliton. The pacemaker is on the left of the figure and represents the projection of the Consciousness of Reality onto Reality. The material carrier of the projection in Reality is DNA, which contains the file - "consciousness". Hence the file - "consciousness" is the DNA of the living in (i) minus the DNA of the carrier of "consciousness" in the form of a test R 6, VC 4 and VC·17, for the selection of therapeutic benefit groups in the absence of fertility.

Adhering to the established tradition, want notice what the therapeutic effectiveness of F-programs, in relation to infections and invasions, is so superior to allopathic methods of treatment that, without any doubt, the Ministry of Health of the Russian Federation could afford to mark this work of the IMEDIS team as state-significant, without waiting for the appearance on the market of patented "Analogues".
