

A case from practice. Treatment of polycystic ovary
V.G. Babich, A.M. Starikov
(MLPU city hospital No. 8, Rostov-on-Don, Russia)

Patient H., 40 years old. Has addressed about polycystic ovary on ultrasound. The left ovary was removed. A month later, it was recommended: control ultrasound with possible removal of the right ovary.

With ART in the small intestine and the right ovary, ascariasis is determined. Prescribed Vermox 100 mg 2 times a day in three-day courses on the new moon and full moon. After a month of control testing, ascariasis was not revealed. On the control ultrasound, polycystic disease of the right ovary is not detected. The operation was canceled.
