

Some aspects of alcoholism treatment with induction programs

N.V. Grushina
(Moscow, Russia)

The problem of alcoholism is so acute in our time that I think any positive moments will be important for both the doctor and the patient in the fight against this common ailment.

We literally saved my brother, since all the well-known, recognized methods could not help.

The patient has been suffering from alcoholism for several years, recently there has been a sharp increase in drunkenness, that is, in the last month before the start of treatment, the narcologist was called 3 times, and the period of sobriety lasted 2-3 days.

The patient's condition at the time of treatment was characterized as alcohol dependence of stages 3-4, there were tremors of the extremities (he could not carry the spoon himself), auditory and visual hallucinations, delirium, memory impairment, sleep disturbance, urinary retention, vestibular and mental disorder (unwillingness to live, irritability, tearfulness).

Having consulted with colleagues who also work with the devices of the IMEDIS Center, I decided to use induction programs No. 8, 15 and 19 in the treatment at an intensity of 100. The device "IMEDIS-DT" worked in swing mode for several days in a row, a belt of 2-3 additions was alternately on the patient's neck or head.

Changes in the state began within a few hours on the same day. 1 day. After the start of the treatment, I slept without waking up for 4 hours, spoke weakly, but meaningfully, and the kidneys began to improve. During sleep, he moaned, growled, chills began, which shook him, but the patient continued to sleep, and when he was pushed aside, he opened his eyes, but fell asleep again. In the evening I asked for vodka, but I could only drink a sip, and then I drank the kidney collection.

2nd day. Aggravation: in the morning I went to the toilet myself, the vestibular apparatus recovered completely, consciousness is unclouded, and ate. At 14-00, a strong chill began, the patient literally "got sick", said that he was dying and felt very bad, felt a state of fear, nervousness, but at the same time asked to call a narcologist to put an IV, and also said that "a loop suffocates him." A very difficult day and the same night.

Day 3. The device works, the patient does not drink, they called a narcologist to put on a drip, and turned off the device until the evening, and then they put on the mentioned programs again.

4th day. He wore a belt around his neck on his own, then took a shower, had a good appetite, drank a lot of kidney and liver teas, and went for a walk.

And then the patient's condition remains consistently good, and there is a real impression that the old, normal person has returned to us.

The brother is actively looking for work and gradually returns to normal life.

Additionally, I decided to add mesenchymal metabolic drainage 6 globules 3 times (OHOM homeopathy).

Today the patient's eyes are clear, he got a job in his specialty, he has a taste for life, and this is my old brother.

Thanks to my friends "Imedis", with God's help, I hope everything will be GOOD.
