The endocrine system is a system that regulates the activity of individual cells and organs. In recent years, modern endocrinology has made significant progress in understanding the diverse manifestations of the influence of hormones on the processes of the body's vital activity.

The synthesis and secretion of hormones is regulated by the nervous system either directly or through the release of other hormones and humoral factors. The role of the "endocrine brain", which has long been attributed to the pituitary gland, is currently assigned to a special "hypophysiotropic" region of the hypothalamus. Under the strict control of the hypothalamus, the pituitary adrenal, pituitary-thyroid and pituitary-gonadal systems.

A special role is given to the endocrine system in the mechanisms of reproduction, information exchange, and immunological control. The endocrine system is closely related to cardiology, gynecology, gastroenterology, ophthalmology, and oncology. Knowledge of the endocrine mechanisms of metabolic disorders underlying the pathogenesis of many diseases can help in choosing an effective method of treatment, taking into account the individual characteristics of the organism.

Bioresonance therapy and homeopathy are effective methods of concomitant therapy for most endocrine diseases, such as:

- diseases of the thyroid gland (diffuse toxic goiter, hypothyroidism, thyroiditis);
- diabetes;
- obesity;
- diseases of the genital glands.

The combined use of homeopathic, resonant-frequency drugs and BRT in the treatment of these diseases expands the possibility of treating and preventing complications of these diseases.

Benefits of BRT:

- lack of side effects;
- no toxic effect on the human body, which is important in the presence of severe complications and concomitant diseases;
- does not cause allergic complications;
- enables a strictly individual approach to each patient in the choice of homeopathic remedies and their dosage;
- ART and BRT methods do not exclude the use of allopathic drugs in the treatment and make it possible for them to be individually selected and optimally accurate in dosage.

In recent years, the doctors of our center have often faced the problem of menstrual irregularities and infertility. According to the WHO, in 30% of cases of infertility, the cause is endocrine disorders.

Example

Patient K., 25 years old, was observed in our center. Diagnosis: S. Stein-Leventhal (ovarian hyperandrogenemia of non-neoplastic genesis). The main tactic of therapy was aimed at normalizing hormonal levels. Were used: endogenous bioresonance therapy, induction programs therapy, color therapy.

We used preparations for corrections psycho-emotional state: Bach flowers, Roy preparations Martin ("Guna"), high potency homeopathic medicines.

Work was carried out to activate consciousness and subconsciousness by the patients center's psychologist.

Pregnancy came after 2 months.

Pregnancy proceeded without complications, delivery on time, independent. The baby was born healthy. Apgar score 9/10 points. Breastfeeding up to 1.5 years. The child is currently 2 years old.

This example discouraged obstetricians and gynecologists and at the same time gave hope that the impossible is possible!
