

An example of the treatment of enterocolitis

A.A. Shmelev

("Center for Energy Information Medicine", Samara, Russia)

A 20-year-old patient turned to the Center with complaints of flatulence, unstable stools (from constipation to liquid, not always depending on the type of food taken), discomfort and sometimes pain in the epigastrium and right hypochondrium.

After diagnostics using the ART method, parasitic and fungal burdens of the small and large intestines, hepato-biliary zone, signs of cholecystitis, chronic colitis, and dysbiosis were revealed.

Therapy was performed:

- a course of resonance frequency therapy for the identified pathogens;
- several sessions of bioresonance therapy (first, treatment along all meridians through the optimal step to harmonize the general condition, then aiming at the most affected organ, in particular, the gallbladder);

- a course of cleansing enemas with the simultaneous colonization of the intestines with normal microflora;
- treatment with drainage preparations of the company "OHOM";
- an individual diet.

A month after the start of treatment, the patient noted an improvement in overall well-being, a tendency towards normalization of the stool, and the disappearance of pain. Periodic discomfort in the right hypochondrium persisted.

At the control admission, an increased toxic load on the liver with toxins of pathogens was revealed due to the patient's non-compliance with the drinking regimen during resonance-frequency therapy. Resonance frequency therapy was temporarily canceled, it is recommended to increase fluid intake. Bioresonance therapy of the liver was performed, hirudotherapy was recommended.

At the follow-up appointment a week later, the patient no longer complained of discomfort in the liver area.

Since the history of the identified diseases is several years, the patient was pre-configured for long-term treatment with periodic monitoring of the condition and the achieved treatment results at the doctor's appointment. The treatment is currently ongoing.
