

Case from practice
SOUTH. Petrov
("Center for Energy Information Medicine", Samara, Russia)

At the initial admission, patient K. complained of severe weakness, dizziness, joint pain, increased sweating, heaviness in the right hypochondrium and decreased potency.

Previously, the patient was identified on K.T. multiple hemangiomas of the liver. In the last year - frequent respiratory diseases. History of repeated urogenital infections.

During the diagnosis by the ART method, a pronounced depletion of the immune system was tested, autoimmune processes 1,3 - respectively, in the prostate, joints (1) and in the left lung (3), in which the onco-protein D6 was also tested.

When testing nosodes in these organs, fungal-bacterial flora is noted. Chlamydia, hemolytic streptococcus, and black aspergillus turned out to be the key nosodes of autoaggressive processes in these organs. In the biochemical analysis of blood, a moderate increase in transaminases was noted. MRI revealed a slight darkening in the left lung of unknown origin.

Repeated courses of complex therapy were carried out, which included sessions of BR-therapy using drainage mono- and complex homeopathic preparations from Heel, OHOM, as well as nosodes in inversion (at the beginning of therapy) and directly (in subsequent courses). Resonance frequency therapy was performed. The choice of the BR-therapy strategy was carried out mainly through the optimal step in terms of adaptation reserves.

Phytocomplexes with targeted action on drainage and normalization of the function of the gastrointestinal tract, inhalation, bronchodilator drugs, as well as phyto- and homeopathic drugs were prescribed in order to restore the functional activity of the MPS organs (simultaneously with etiotropic and pathogenetic BR-therapy).

As a result of the therapeutic measures, the patient's well-being and condition improved significantly, the joints stopped hurting, mental and physical activity, as well as libido, increased. Indicators of severe depletion of the immune system changed to indicators of moderate stress, and markers of autoaggressive and oncological processes were no longer tested.

The patient is currently undergoing preventive BR-therapy and homeopathic treatment in order to stabilize the results.
