

Pathogenic influence of some factors of allopathic treatment
on the human body
T.N. Oparina
(Moscow, Russia)

As in the time of Hahnemann, so in our time the main thesis of the Organon remains relevant: the only purpose of a doctor is to heal quickly, gently, and finally. However, sometimes even correctly prescribed treatment does not alleviate the patient's condition. Back in his time, Hahnemann wrote that we cannot forget about the common diseases caused by allopathic treatment. As examples, he cited the abuse of calomel, sulfuric mercury ointment, silver nitrate, iodine and its compounds, opium, valerian, cinchona bark, digitalis, hydrocyanic acid, etc. "All this mercilessly drains the vitality," Hahnemann said, "and if it does not stand up, it gradually eats it up." In our age of developed chemical and pharmaceutical industries, the age of antibiotics, vitamins, dietary supplements and other medicinal products it is difficult to find at least one person who has never used these medications. Most often people who have tried many methods of treatment of allopathic medicine come to see a homeopath.

Case 1

A 38-year-old patient of average build, a brunette, complained of severe weakness in the legs, dizziness, ringing in the ears, headache, a feeling of suffocation, pain in the coccyx. From the anamnesis it became known that all the symptoms appeared after a two-week intake of a tincture of valerian root, which she took over the grief that befell her - the death of her mother, to whom she was very attached. As you know, in high doses in sensitive people, valerian has a toxic effect - dizziness, blurred vision, headache, etc.

It was recommended to stop taking valerian tincture. After two weeks, the patient's condition improved significantly - the weakness in the legs decreased, dizziness and ringing in the ears disappeared. The prescribed homeopathic treatment - Ignacy 30 once a day, 2 times a week - finally eliminated all the patient's complaints.

Case 2

A 62-year-old blue-eyed, fair-haired, medium-build patient complained of poor health, palpitations, heart discomfort, insomnia, unexplained anxiety during the day, bulging itchy red spots all over the body. It is known from the anamnesis that a patient diagnosed with hypertension and atherosclerosis underwent diagnostic aortography with a contrast agent containing iodine a few days ago. According to the performed aortography, only insignificant age-related changes in blood vessels were found. Two days after the examination, itchy red spots appeared on the patient's skin.

The patient consulted an allergist. Was appointed antihistamines drugs. However, after five days on the background of treatment with antihistamines

drugs, the patient's condition continued to deteriorate - red spots on the skin and itching of the skin intensified, anxiety, pronounced palpitations, high blood pressure, lacrimation from the eyes, headache, insomnia appeared. Consulted with a cardiologist. The conducted cardiological examination did not reveal any pathology of the heart.

The complex of phenomena of subacute iodine poisoning is known in medicine under the name of iodism. It occurs in individuals with hypersensitivity to iodine. The symptoms of iodism are acute catarrhal inflammation of the mucous membranes, swelling of the tonsils and parotid glands, the appearance of a special form of dermatitis - iododerma, as well as the presentation of insomnia, palpitations and complaints of increased excitability.

Given the constitutional data patient with increased sensitivity to iodine-containing drugs, Iodine 6 was prescribed twice a day in the morning and evening after meals, for three days. Then Iodine 12 once a day for three days, and two days later Iodine 30 once a day for one day. A week later, the patient called on the phone with gratitude - his condition improved significantly: the itching of the skin disappeared, the lacrimation from the eyes stopped, the heartbeat stopped, the pressure returned to normal. The patient's condition stabilized and he returned to normal life.

Hahnemann also wrote about the effect on the body of mineral baths: "a doctor practicing in our area will never prescribe a patient any of the countless mineral baths, because almost all of them are unknown in terms of their exact, positive effect on a healthy body, and if they misused, it must be considered among the most powerful and dangerous drugs. "

Case 3

A 45-year-old patient of average physique, a brunette complained of feeling unwell, dizziness and recurrent sensations that everything was floating before her eyes.

A month ago, the patient had no complaints and was fully examined as a preventive measure for a trip to a health resort. In the sanatorium, she took radon baths for two weeks as prescribed by the doctor of the sanatorium. As you know, radon baths have a specific effect on the body due to alpha radiation that occurs during the decay of atoms of a radioactive gas - radon. Radon has a pronounced sedative and analgesic effect, improves the activity of the heart, and normalizes blood pressure. Under the influence of radon, the healing and resorption processes in nerve fibers, muscle and bone tissue are accelerated. Two weeks after returning from the sanatorium, the patient developed the above complaints. After testing by the method of R. Voll, it was revealed that the patient responds to the drug Radium Bromatum 6. The drug was prescribed for one week, once a day. After two weeks, the condition improved. When tested by R. Voll's method, no reaction to Radium bromatum 6 was observed. Further, taking into account the data of the anamnesis, as well as the constitutional characteristics of the patient, the drug Nux vomica 30 was prescribed once a day every other day. After a month of treatment, the patient's condition returned to normal.

As Paracelsus wrote: "Everything is poison, and nothing is devoid of poisonousness; and only the dose decides what is poison. " Thus, the mechanism of occurrence of both the therapeutic effect and the pathogenic effect depends both on the dose of the drug substance and on the patient's constitutional sensitivity to this substance. When doctors prescribe a particular procedure or drug, it is necessary to take into account not only the dose of the drug, but also the individual (constitutional) sensitivity of the patient to this substance.
