

Advantages of the method of multilevel  
systemic spiritual adaptation therapy  
S.N. Guseinov, T.S. Huseynov (clinic  
"Yeni Med", Baku, Azerbaijan)

Our experience with IMEDIS equipment is over 8 years. In earlier articles, we reported a high degree of accuracy and efficiency of the IMEDIS apparatus in diagnosing and destroying the causes of most diseases - viruses, microbes, worms, protozoa, fungi. In many cases, as a result of this treatment alone, many diseases can be cured. But there were also difficulties. Some of them were overcome due to the inclusion in our practice of the MSDAT method, which we managed to master only 3 months ago.

Here are some examples.

1. Patient H., 63 years old. For about 20 years he has been worried about coughing fits. Numerous examinations and treatments in clinics in Moscow, Iran, Turkey, Germany were ineffective. The patient was diagnosed with whooping cough using the ART method. Pertussis is officially considered a disease of childhood and adolescence. The disease lasts about 3 months. After recovery, strong immunity is maintained for life. On the territory of the former USSR, all children are now vaccinated with DPT. It is believed that after vaccination, immunity also lasts for life. Re-infections are excluded. But it turns out that this is not always the case. In our practice, there were 18 patients with long-term chronic cough. 14 children from 5 to 14 years old and 4 adults over 50 years old. In all these patients, only the bacterium whooping cough (*Bordetella pertussis*) was tested by ART. Some of these patients have had repeated sputum cultures over the years. They were prescribed antibiotics, antitussives and expectorants, inhalation. However, the pertussis bacterium was not only not identified, it was not even suspected! We used to kill these bacteria with the appropriate resonant frequencies. Recovery occurred within 3-4 months or more. A severe, spastic cough continued to torment the patients long after the bacteria were destroyed. This trial reduced confidence in the effectiveness of the treatment. Therefore, we began to treat patient H. with the MSDAT method. We adapted the pertussis nosode to KMH, selected a key fateful drug and SDA. On the same day, the cough became softer and less frequent, which, of course, impressed the patient and facilitated his further treatment. Recovery occurred within 3-4 months or more. A severe, spastic cough continued to torment the patients long after the bacteria were destroyed. This trial reduced confidence in the effectiveness of the treatment. Therefore, we began to treat patient H. with the MSDAT method. We adapted the pertussis nosode to KMH, selected a key fateful drug and SDA. On the same day, the cough became softer and less frequent, which, of course, impressed the patient and facilitated his further treatment. Recovery occurred within 3-4 months or more. Therefore, we began to treat patient H. with the MSDAT method. We adapted the pertussis nosode to KMH, selected a key fateful drug and SDA. On the same day, the cough became softer and less frequent, which, of course, impressed the patient and facilitated his further treatment.

2. Patient T., 11 years old. For the last 4 days he cannot even drink. Right here vomiting of bile occurs. He is being treated in a hospital. The diagnosis has not been established there. Supported by droppers. No stool for 4 days. The abdomen is soft, not swollen, painless. The patient is very weak, can hardly sit. Nausea and vomiting periodically bothered him for 1.5 years. Have become more frequent in the last month. A bovine tapeworm was revealed by the ART method. Previously, we began the treatment of patients with bovine tapeworm with the destruction of the parasite with the appropriate resonant frequencies. But that was not the case. The boy was severely weakened (according to the level of development of the disease, he was in the syphilitic miasm). The destruction of parasites in this state is fraught with mortal risk due to the possible severe intoxication. But also leave the patient only for

droppers, without destroying the bovine tapeworm, was no less risky. Therefore, treatment began with the MSDAT method. The bovine tapeworm nosode was adapted to the KMH, a key fateful drug and SDA were selected. Vomiting attacks became less frequent and stopped in a day. The patient began to drink and eat little by little, and he gained strength. This made it possible to destroy the parasite with resonant frequencies without risk. After another 2 days, the patient was already laughing and was in a satisfactory condition.

3. Patient P., 60 years old. For more than a year she has been worried about an allergic rash with itching, periodically there were Quincke's edema with difficulty in breathing. Examination and treatment in different hospitals in Baku and Russia without effect. The ART method revealed opisthorchias in the liver and whipworms in the colon. Previously, we started treating such patients with the destruction of parasites with appropriate resonance frequencies. At the same time, an exacerbation of allergies was often observed at the beginning of treatment. In this case, it could provoke Quincke's edema with severe respiratory failure. Therefore, we started the treatment of this patient with the MSDAT method. The opisthorchus nosode was adapted to KMH, a key fateful drug and SDA were selected. This made it possible to prevent the aggravation of allergies and calmly end the treatment.

One of the most important advantages of the MSDAT method is the method developed by the authors of this method for diagnosing external negative influences (damage, evil eye) and its elimination. In our practice, there were patients whose potency was restored only after the elimination of a negative external influence, long-term bronchial asthma, headache, chronic fatigue passed. No less interesting results were obtained with cardiac patients.

4. Patient S., 62 years old. Diagnosis: rest and tension angina and feeling fear. Coronary insufficiency was confirmed by stress bicycle ergometry. He was offered coronary angiography. There is no concomitant pathology. Insufficiency of the coronary arteries was confirmed by the MSDAT method, and negative external influences were diagnosed and eliminated. Two weeks later, this patient underwent angiography in Istanbul. The coronary arteries were found to be completely healthy. The feeling of fear has passed. In our practice, this is already 2 such cases.

For 8 years of work with the equipment "IMEDIS" in our practice there were more than 12000 patients of different ages and with very different diseases. Frequency resonance therapy was not used only in 267 patients (2.3%). In the rest of the patients, frequency resonance therapy was used according to the indications revealed by the ART method. The destruction of parasites was carried out only by the corresponding resonant waves. As a result, most of the patients were cured of a variety of diseases: bad breath, stomatitis, bleeding gums, nausea, vomiting, hypersalivation, belching, gastritis, duodenitis, stomach and duodenal ulcers, constipation, chr. diarrhea, dysbiosis, ulcerative colitis, recurrent illness, cholecystitis, pancreatitis, hepatitis of helminthic and viral origin (A, B, C, D), virus

rubella, genital herpes, cytomegaly, mumps, shingles, amoebic dysentery, leptospirosis, listeriosis, salmonellosis, visceral leishmaniasis, malaria (including 2 cases of deadly tropical malaria), allergies, Quincke's edema, anemia, anemia, headache, headache, anemia, , xp. fatigue, menstrual irregularities, infertility, miscarriages, prostatitis, prostate adenoma, chr. cystitis, impotence, impaired quality and quantity of sperm, nodular and diffuse mastopathy, nodular and diffuse goiter, skin and genital itching, focal, diffuse and total hair loss, eczema, neurodermatitis, furunculosis, urticaria, chronic cough,

bronchial asthma, tuberculosis, brucellosis, rheumatism and rheumatoid arthritis and many others.

In our practice, there are patients with a histologically confirmed diagnosis of cancer of various organs. The ART method in such patients often reveals the presence of a negative external effect, worms (alveococcus, echinococcus, Trichinella, schistosoma, paragonimiasis, toxocar, cysticercosis, dirofilaria, opisthorchias, clonorchis, fasciola), fungi (mycosis fungoides, aspergillus, cladocopia actinomycosis). Many of these patients were cured after the destruction of parasites by resonant frequencies (now also by eliminating the negative external influence).

I draw your attention to the fact that almost none of these types of parasites can be accurately diagnosed using ultrasound, X-ray, NMR, endoscopy, laboratory tests. For some parasites, there are practically no methods of intravital diagnostics (for example, dirofilaria, visceral leishmaniasis). Let me remind you that almost the entire population of the Earth is infected with various types of parasites. They can live in all human organs, damaging and disrupting their functions and are the cause of many different diseases. Before ART, there was no accurate method for diagnosing parasites. Therefore, many doctors, including histologists, do not even remember the names of many parasites. This means that most histologists do not know what the cells of these parasites look like under a microscope. Moreover, they are not even looked for there. In such a situation, all cells that do not look like cells of human organs

highly differentiated, etc., that is, cancer cells! Before IMEDIS, there were no effective methods of killing parasites. There are many antiviral drugs. They, at best, can only delay the multiplication of viruses. There are no drugs that destroy viruses anywhere in the world. There are no effective drugs against most types of bacteria, protozoa and fungi, worms either. All is clear about side effects and medicinal complications. The ingenious creation of the IMEDIS Center Scientists, developed by no less ingenious method of multilevel systemic spiritual adaptation therapy, can work miracles in the hands of good doctors. Widespread use of IMEDIS can prevent many diagnostic and therapeutic errors.
