

Bioresonance therapy method in experimental oncology and biophysics cancer (review of the literature based on the materials of the conferences "IMEDIS")

V.P. Zaderin

(Rostov Research Oncological Institute of the Ministry of Health of the Russian Federation,
Rostov-on-Don, Russia)

(1) conducted an experimental study on 79 mice (37 - main and 24 - control group), who were vaccinated with Ehrlich's carcinoma. In the control group, imitation of BRT was carried out, and in the main group, various BRT strategies were carried out. The use of an inverse preparation of Ehrlich's carcinoma made it possible to increase the life span of animals by one third in comparison with the control group and "pure" BRT.

(2) the review article deals with the diagnosis, treatment and basic properties of cancer

cells: rigid constructive interference of a cancer cell leads to a stimulus for its growth; chaotic radiation of energy into the environment stimulates the growth of neighboring cells; ash state of the matrix of cells; unprofitable metabolism; catabolism and other signs are characteristic of a malignant cell. Cancer diagnostics should be multifactorial and include not only visual research methods, but also biochemical, psychological and resonance frequency tests. The concept of cancer treatment is based on the thesis that pathologically altered tissues cannot disappear as long as nothing changes in the field surrounding the patient, and the negative aspects of the way of life (physical and mental) continue to exist. Therefore, it is necessary to treat an oncological patient in interaction with his environment; cancer monotherapy is not permissible. B. Keller proposed a scheme for the treatment of malignant tumors, which was named by the author as "Universal Naturopathic Integral Therapy" (UNIT) and consists of 4 stages: 1. Find the psychological causes that contribute to the development of the tumor ("initial blockade") and resolve them in the Subconscious. 2. With the help of bioinformation technologies, compose a new program of the quantum field of the aura for the patient and reprogram it (sanitation of the aura). 3. Integrate the patient into a new quantum field of the environment (resolve conflicts: profession, family, home). 4. Therapy of the somatic manifestations of the disease (clinical symptoms, strengthening the constitution, relieving prolonged stress, detoxification, immunotherapy). To solve these problems, the doctor must be a professional and creative person. which is named by the author as "Universal Naturopathic Integral Therapy" (UNIT) and consists of 4 stages: 1. (3) believe that a complex protein is present in a cancer cell, consisting of from M-substance, constantly formed in the body, and P-substance, supplied with food. Under the influence of pathogenic factors affecting the body (physical, chemical, biological, hereditary predisposition to cancer), there is an excessive accumulation of substance M, which is similar to 1-methyl-4-phenyl-1,2,3,6, -tetrahydropyrimidine (MFTR). Substance M, interacting with the complex of the mitochondrial respiratory chain, promotes disruption of electron transport from cytochrome oxidase, the formation of superoxidases and the formation of a complex compound - MP + protein. The latter is easily incorporated into the genetic apparatus of the cell and removes the prohibition on division. On the surface of the cancer

cells appear hexonidase, which breaks down glucose and creates a dead zone around the tumor with blocking receptors. The tumor gets out of the regulatory influence of the body and becomes tolerant to the immune system. The authors report that a synthesized MR-antiprotein-blocker prepared from the histogenetic substance of the patient himself can destroy the tumor in 30% of incurable patients.

Summary

These publications show:

1. Resonant wave techniques should be actively implemented in experimental oncology, which will expand the information about the features of the resonant-wave characteristics of the tumor cell and the ability to influence it with weak control frequency signals.
2. Treatment of cancer patients should be comprehensive and include: resonance-wave, biochemical, psychological and physical methods of influencing the tumor.
