

Allergic diseases and their treatment using bioresonance methods therapy

I.A. Tumanov

(Center for Integral Medicine "Zdravitsa", Belorechensk, Krasnodar Territory, Russia)

Allergy is a disease of the XXI century, one of the most common on Earth. According to statistics, today every fifth inhabitant of our planet suffers from it. International statistics show that over the past two decades, the incidence of allergies has increased 3-4 times, and the disease often proceeds in a severe, unusual form. This is due to the increased allergenic load on humans.

The deteriorating environmental situation, poor nutrition, excessive drug therapy, uncontrolled use of antibiotics, stress, a sedentary lifestyle, changes in climate - all this increases the human body's susceptibility to allergens.

The use of the BRT (bioresonance therapy) method quite often cures allergies, almost always facilitates the course of allergies, but it must be remembered that allergies are complex changes in the whole body, therefore it is difficult to completely recover from it. This is possible with the efforts of the physician using bioresonance therapy, and the effort of the patient to change his lifestyle, it is possible. Often the cause of allergies is the syndrome of bacterial overgrowth in the intestine, helminthiases, chronic intoxication with heavy metals, etc., which can be detected by the method of vegetative resonance test (ART). If you eliminate the specific cause, you can get rid of the allergy forever.

During the year of work (2012–2013) with IMEDIS devices at the Zdravitsa Center for Integral Medicine, 48 patients with various allergic diseases (bronchial asthma, allergic dermatitis, food allergies, pollinosis, etc.) were examined and treated. The age of the treated patients ranged from 5 to 68 years.

Patient management tactics consisted of the following stages:

1. Collecting an allergic history, the purpose of which is to compile preliminary judgment about the form of the patient's allergic disease; identification of factors provoking the manifestation of symptoms of the disease; selection of allergens (food, household, plant, ecotoxins, etc.) for

allergy testing (ART).

2. Conducting ART with the determination of the etiological factors of allergic diseases - identifying the root cause of the disease (psycho-emotional stress, geopathogenic, radioactive, electromagnetic load, dysbiosis, helminthiasis, foci of chronic infection in the body, etc.). Depending on the identified pathology, the choice of treatment is carried out, which may include the selection of homeopathy, in order to correct certain disorders in the body; work with psycho-emotional stress (preparations Bach Flowers, preparations developed by ROY MARTINA, etc.); elimination of geopathogenic, radioactive, electromagnetic load (drugs from Reyeks, IMEDIS, etc.); dysbiosis treatment; resonance frequency therapy to get rid of helminthiasis and chronic foci of infections, etc.

3. Determination of allergens with the help of ART provoking the development an allergic reaction in the body. As a result of testing, the identified allergens are either assigned in inversion, or contact with them is completely excluded.

4. Testing food for the selection of a non-allergenic diet.

5. Testing the most affected meridians and conducting meridian therapy.

6. Selection of homeopathic medicines for the purpose of drainage and detoxification in the patient's body (for example, DRE and DIS by ONOM; sometimes drugs of the DETOX and ENDOTOX groups developed by ROY MARTINA are used).

7. Carrying out endogenous bioresonance therapy - basic therapy (circular, horizontal), 3,4 strategy with the transition to 2.

Clinical examples

1. Patient A., 26 years old.

Complaints

06/04/2012, she turned to the CIM "Zdravitsa" with complaints of nasal congestion (in order to facilitate breathing, she uses Otrivin, Nazol, Xsemelin up to 10 times a day), lacrimation, itching of the eyelids, worsening sleep, nervousness, increased sweating of the palms, inflammatory diseases of the female genital area (genital infections, cervical erosion), diffuse hair loss (alopecia).

Anamnesis

Nasal congestion first appeared in 2006 (6 years ago) - first in September, according to the patient, during the ragweed flowering period. I went to an allergist, and were prescribed antihistamines. In 2007, the symptoms recurred in the same period. Nasal congestion and watery eyes were controlled by antihistamines. In 2008, the period of allergic manifestations increased in duration and began to be 2 months August and September, nasal congestion and lacrimation became more pronounced and were difficult to stop with antihistamines, while the patient developed sleep deterioration and nervousness. In 2009–2011, antihistamines stopped helping and the patient stopped allergic manifestations by intramuscular administration of glucocorticoids (betamethasone, 1 injection per month). In 2010, the period of allergic manifestations increased in duration and began to be: May, then a break in June-July, and again allergic manifestations appeared in August and September. In 2011, June was added to the above months.

The patient was repeatedly examined in various public and private medical centers in the city of Krasnodar and Rostov-on-Don, various methods of allergy treatment were prescribed, but over the past 4 years, only the introduction of glucocorticoid drugs has eased the condition. With the help of laboratory tests, an allergy to ragweed, Chernobyl, wormwood, house dust and other allergens was established.

Treatment

The first appointment on 04.06.2012. Diagnostics was carried out using the ART method with the selection of: Reyeks preparations for removing the electromagnetic load, homeopathic remedies for eliminating the psycho-vegetative load and relieving allergies. In order to restore homeostasis, endogenous bioresonance therapy was carried out, and meridian drugs were tested and included in the treatment.

The second appointment on 09.06.2012: the patient notes the disappearance of the itching of the eyelids, the improvement of nasal breathing, Otrivin, nasol or xsemelin is used no more than 2 times a day. The patient's prescription was revised, additional drugs were selected. Testing of indications for the presence of parasitic burden in the body and selection of frequencies in order to eliminate it was carried out.

The third reception on 11.06.2012: does not use symptomatic drugs - nasal breathing is free, there is no itching of the eyes. But the presence of allergies is being tested, so we continue the therapy. The indication of several types of parasites is not tested, the course of resonance frequency therapy continues. Therapy started with

the purpose of strengthening hair, eliminating the root cause of alopecia and improving hair growth. The ART method tested the deficiency of the following microelements: zinc, sulfur, molybdenum, which is important for hair growth, and an excess of cobalt. Appropriate therapy was selected and foods rich in the above microelements were recommended.

Reception 06/18/2012, 06/20/2012, 06/22/2012 - resonance frequency therapy (after the therapy, the indication for the human papillomavirus, mycoplasma, gardnerella, staphylococcus, clostridia, etc. is not tested).

2. Patient K., 53 years old.

Complaints

Complaints of discomfort and rumbling in the abdomen, flatulence, chronic constipation. Severe pain in the liver area, up to ambulance calls. Allergic rashes and itching of the skin, especially the upper extremities, mucous transparent discharge from the nose. Frequent colds, insomnia.

Anamnesis:

All of the above complaints have been troubling for many years. Discomfort, rumbling, abdominal pain and constipation worsened after a cleansing enema treatment in a sanatorium. Taking into account the specifics of the work - irregular working hours, it is very difficult to fall asleep, the work is nervous. The patient smokes. Normal food - any food in any quantity.

Diagnostics and treatment

05/21/2012 at the first admission revealed thin and thick dysbiosis intestines, psycho-vegetative load, chronic allergic processes - appropriate treatment was selected. Including the indication of bacterial, viral and parasitic burden was tested, - resonance-frequency therapy was selected. In order to reduce the psycho-vegetative load and normalize the activity of the brain, induction programs were selected: Stress III Program, Cerebral Program and Sleep Program. Also, the patient was advised to quit smoking and streamline nutrition.

Reappointment 22.05.2012. According to the results of the diagnosis, resonance frequency therapy and induction therapy were prescribed to normalize the brain activity.

Given the specifics of the work, the next reception was carried out in a month - 06/29/2012. The patient notes the absence of constipation, normalization of intestinal activity, but discomfort and rumbling persist. Absent

allergic manifestations on the skin, no itching, no discharge from the nose, normalized sleep.

The following receptions 07/30/2012 and 08/27/2012 - There are no above complaints.

During the period of treatment since May 2012 (4 months), the patient has never had colds, although at work almost every month is sick.

Thus, summarizing the results of the examinations and treatment of patients with allergic diseases, the following conclusions can be formulated:

1. Allergic diseases are polyetiological, therefore patients need diagnosis of the whole organism as a whole and elimination of the leading root causes of the disease.
2. An important role in the development of allergies is played by geopathogenic, radioactive, electromagnetic and psychoemotional load on the body.
3. In the treatment of allergies, due attention must be paid to treatment chronic foci of infection and the elimination of parasitic burdens.
4. Of the 48 patients treated with various allergic diseases (bronchial asthma, allergic dermatitis, food allergy, hay fever, etc.): persistent improvement (cure) is noted - 29 people (60%), relative improvement - 16 people (33%), no improvement - 3 patients (6%). The presented results indicate a relatively high efficiency of bioresonance therapy methods in the treatment of allergies.
