

The importance of staging rehabilitation in increasing efficiency
bioresonance
therapy in persons with neurostomatological diseases and concomitant
pathology
M.N. Orlov
(Stavropol State Medical Academy, Stavropol, Russia)

Electro-acupuncture diagnostics gives the doctor the opportunity to identify a large layer of problems in the patient's body already at the initial appointment.

The holistic approach is based on the fact that any disease, as a deviation to one degree or another from the state of homeostasis, is a consequence of the accumulation in the human body, in its bioenergy-informational structure, of an increasing number of burdens (toxic, viral, bacterial, parasitic, etc.). The appearance of disharmonious fluctuations in the system introduces discord, both in the energetics and in the biochemical reactions of the cellular level. The causes of failures can be multiple not only pathogenic factors of the material level, but also informational loads on a person, including stress. Often, going deeper in particular, the general picture is missed, which slows down the healing process, achieving a stable remission.

The purpose of our article was to outline the general principles of the sequence of work with the patient, as a result of which the restoration of his health in the future would proceed much faster with minimal participation of the doctor.

When working with neurostomatological diseases, which we focused on in the materials of the conferences, we identified burdens with pathogenic biological objects (neurotropic viruses, fungi, harmful environmental factors, etc.). Rational use of adaptogens, drainage homeopathic remedies, bioresonance drugs gave a fairly stable remission, the duration of which was different.

Doctors are well aware of the fact that working with positive-minded patients is always more effective. Such persons build their anticipated future, as it were, through bright positive images. It was noted that the clarification of the stages of work, mechanisms of recovery and ways of maintaining health, including through a healthy lifestyle, is also positive.

In our practice, we adhere to the sequence of stages of restoring the patient's health. At the first stage, our task is to help in stopping the main complaints at the time of contact. In the case of a properly selected homeopathic preparation (homaccords are often the most effective), BRT and, as a consequence, a positive result is achieved, the patient is more responsible for further recommendations. It should be emphasized that a quick effect can be obtained in acute conditions. Chronic pathology requires patience. If we identify chronic foci of infections (dental foci, ENT pathology, etc.), we prescribe a mandatory sanitation by the appropriate specialists.

The next factor on which we focus is

helminthic invasions. Identifying, eliminating them, explaining how to prevent re-infection is important for unloading the patient's body.

Further, the identification of the burden of protozoa (lamblia, Trichomonas, etc.) is carried out, their elimination and recommendations to patients how not to become infected with them in the future. Often, the elimination of Trichomonas in the nose and the further observance of hygiene contributes to a sharp decrease in the manifestations of allergies. The relevance of the approach also lies in the fact that parasites may contain other infectious "stuffing", which should also be removed.

Determination and elimination of chronic intoxications, symbiotic appointment microorganisms and normalization of intestinal microflora, in most cases, contributes to the independent restoration of the immune system. This, of course, prevents the return of pathogenic flora into the tissue. During this period, it is rational to use immunomodulators.

In all cases, the selection and appointment of Bach Colors is carried out for the correction of the psychoemotional sphere, during stressful loads and, especially, in the aspect of relief of irrational fears.

In the course of staged rehabilitation, even in the absence of a narrowly focused correction of neurostomatological problems, a gradual improvement in the patient's condition and a decrease in the manifestations of both initial complaints and other chronic diseases, to which the patient was already accustomed, considering them incurable, were noticed.

Thus, staged rehabilitation in combination with bioresonance therapy turns out to be rational and effective in neurostomatological diseases and contributes to the inclusion of self-healing mechanisms of the health of the human body as a whole. Research is ongoing.

M.N. Orlov The value of the stages of rehabilitation in increasing the effectiveness of bioresonance therapy in persons with neurostomatological diseases and concomitant pathology // XIX
