

The reasons for the development of autism and an example of the treatment of a child with autism with the help of
bioresonance therapy

I.A. Tumanov

(Center for Integral Medicine "Zdravitsa",
Belorechensk, Krasnodar Territory, Russia)

Let neurologists, academicians, professors and other "super" -specialists in autism forgive me for my alleged illiteracy, but I believe that this article has a place to be, if only in order to shake up these same specialists and in general the whole the world community regarding autism. Take this article as a cry for help from many, many parents of autistic children.

The first thing I would like to say is that in a deep study of autism, the global nature of the problem is striking: the magnitude of the pain and grief of the parents and, at the same time, the lack of truthful and reliable information on this problem. It is striking that doctors, as well as psychologists, cannot decide for themselves even whether autism is a disease, or is it just a developmental disorder of children. When studying a huge amount of literature, I came across contradictory statements about autism: according to some authors, autism is a disease, others believe that it is just a violation in the development of a child, to the extent that these are children of "prodigies", out of this world, children "Indigo" and so on.

If we talk about the causes of this disease, then they are still considered unknown. Apparently, heredity plays an important role. If the family already has a child with autism, then the likelihood of this disease in another child is 5-10%. Currently, the probable link between autism and chromosomes 15, 21, 7 and 16 is being considered (but these facts have not been proven - not enough research has been done). There have been suggestions about vaccination as an etiological factor in the development of autism, but at present, no precise data have been obtained to support this theory. Very rarely and timidly, a hypoxic theory is expressed as one of the etiological factors, that is, a lack of oxygen to the brain during pregnancy and during childbirth, for example, the entanglement of the umbilical cord around the baby's neck during childbirth, which implies compression of the umbilical cord itself and, accordingly, insufficient blood supply to the brain. Also, the "seditious" theory of brain trauma, mainly during childbirth, and also in the postpartum period ("seditious", because no obstetrician will confirm the fact of trauma to the skull and cervical spine of a child during childbirth) is also rarely expressed. As a result, there are no officially proven causes of autism, and the number of children with this pathology is growing at an arithmetic progression every year. I just want to ask: where is our research in this area, or is someone interested in the autistic behavior of the nation (non-interference and disruption of communication among individuals)? As a result of examining children using a vegetative resonance test with an officially diagnosed autism, quite often (but not always)

chromosomal abnormalities have been tested, but this does not mean that chromosomal abnormalities are the cause of autism. Also, burdens of various types of vaccines were often tested, while these vaccines had a tropism for nervous tissue, highly toxic neurogenic chemicals (mercury salts, formalin, etc.) were used in their production. At the same time, it is also impossible to speak unequivocally for the etiology of vaccination in the development of autism, although often when eliminating the load of this vaccine on the child's body with the help of bioresonance therapy - the child's condition began to improve. It is worth noting that birth injuries in a child were also often tested, which could lead to the development of autism, as well as the presence of intrauterine and birth infections, more often of viral etiology, less often of bacterial and toxoplasma.

It just so happened that a few years ago, as a doctor practicing bioresonance therapy, a child with an officially diagnosed autism came to see me. And, as often happens, the parents turned to the doctor of bioresonance therapy, having passed all possible specialists (from ordinary neurologists to eminent professors and academicians), were examined in the largest centers in Russia, and received numerous courses of treatment. It should be noted that all efforts were in vain: the child, as he did not communicate with anyone, remained closed, as he performed the same type of actions, so everything remained, as he did not go to the potty, and did not start, as he did not speak, and does not say, in the end, how he beat his head against the wall, so he sat and continued to beat. And in many cases, on the contrary, there was a deterioration in well-being when prescribing certain medications: an increase in hyperactivity, withdrawal. Parents were forced to cancel such treatment, and the doctors could not offer anything else and only shrugged.

After diagnostics by the method of vegetative resonance test on the equipment of the IMEDIS Center, I prescribed therapy with Bach flowers, Guna preparations (Roy Martin), organopreparations of the brain zones, spiritual adaptants, oligopeptides, corrected the lack of vitamins and minerals, eliminated external loads, burdens with vaccinations, heavy metals. The high efficiency of induction programs was noted (most often the Children's program, Schumann waves, Cerebral program, programs of training and memory development were used); identified foci of infection (bacteria, viruses: Epstein-Barr, Herpes, Coxsackie, protozoa and helminths) were eliminated without fail using resonance frequency therapy. Almost always, endogenous bioresonance therapy along all meridians was used in the treatment.

As a result of this therapy, carried out for 6 months, the child became much calmer, stopped clapping his hands all the time, began to ask for a pot himself, the first words appeared in his vocabulary: "Mom, dad, uncle, berry, morning, evening" and many others (up to 30 words), began to recognize his relatives and react to their actions. Imagine the happiness of the parents when, for the first time in 7 years, they saw how their child showed interest in toys, began to examine himself in the mirror, smile, stretch out his hands to his mother, said the first words, shared candy with his older sister and much more.

The first such patient was followed by the second, then the third, fourth, fifth, and in the meantime, I learned more and more about the "secrets" of autism, about how huge a problem it is, what are its causes, and honed my skills in treating these patients.

Conclusions:

1. Given the lack of proven causes of autism, it is necessary to conduct a more thorough study of as many patients with an officially diagnosed diagnosis as possible in order to reliably establish the causes of autism with the involvement of doctors practicing bioresonance therapy who have experience in treating patients with autism.

2. In order to more reliably conduct the vegetative resonance test, and also differential diagnosis with other diseases of the nervous system, think over and prepare test pointers for the diagnosis of autism.

3. Given the lack of effective treatments for autism in classical neurology and the certain effectiveness of the treatment of autism using bioresonance therapy, I believe that this technique can be used in the treatment of autism.
