

Approaches to the complex treatment of patients with epilepsy

V.V. Pogoskaya

(Center "IMEDIS", Moscow, Russia)

Epilepsy is a chronic disease of the brain of various etiologies, characterized by repeated epileptic seizures resulting from excessive neuronal "discharges" and accompanied by a variety of clinical symptoms.

This disease has been studied for a long time. Various classifications of epilepsy are being developed, new diagnostic methods appear to establish the complex etiology of this disease. Today, the treatment of an epileptic seizure is reduced to protecting the patient from injury, and the treatment of status epilepticus is reduced to resuscitation and anesthesia. Whenever possible, IRT is used in treatment. All funds are used to improve the blood supply to the brain, normalize autonomic functions and restore the patient's consciousness.

In the interictal period, the basis of treatment is drug anticonvulsant therapy with a constant risk of side effects (drowsiness, emotional lability, hypertrichosis, gingival hyperplasia, etc.). The risk of developing intolerance, sensitization and tolerance to drugs is high. Methods for the use of IRT have been developed, recognized by official medicine, used during the aura period to prevent the development of an attack, as well as in the interictal period and even during attacks. The use of IRT made it possible to significantly reduce the risk of side effects, but the method can not be used in all patients.

In homeopathic practice, there is a large amount of development on the use of more than two dozen homeopathic medicines in different potencies, both for the treatment of epilepsy in the interictal period, and for use during the aura period to prevent the development of an attack.

For more than 10 years, we have been monitoring patients with epilepsy, in whose treatment bioresonance therapy is used. In the selection of drugs, their dose and potency of homeopathic preparations, drug testing is used according to the method of R. Voll and ART on the APK "IMEDIS-EXPERT".

Output

The use of complex therapy using the capabilities of such diagnostic and therapeutic methods as diagnostics according to Voll, ART and BRT (at the APK "IMEDIS-EXPERT"), homeopathy in such a complex pathology as epilepsy can significantly improve the quality of life of patients and reduce the intake of antiepileptic drugs that are not indifferent to the body. drugs.
