

Application of the vegetative resonance test "IMEDIS-TEST"
in the annual medical examination Yu.N.

Orlov, S.P. Pryadko, S.I. Kalyuzhny
(Rostov-on-Don, Russia)

Clinical examination - active dynamic monitoring of the state of health of the population, including a complex of preventive, diagnostic and therapeutic measures. Clinical examination includes an annual medical examination with laboratory and instrumental studies to detect diseases in the early stages.

The medical center is part of a large enterprise, whose employees undergo a medical examination every year. The list of provided diagnostic measures includes general, special and laboratory tests, as well as ART "IMEDIS-TEST".

From 2012 to January 2015, 1,385 people were examined using a vegetative resonance test (ART). The working age of the tested men and women is from 24 to 54 years.

The main task of ART diagnostics as part of the annual examination. This is the identification of socially significant diseases included in the list approved by the Government of the Russian Federation on December 1, 2004, and the identification of persons who use psychoactive substances.

Equally important is the determination of the state of physical and mental health of the surveyed. Thus, the health passport of the tested according to the ART method includes integrative indicators: biological and photon indices, adaptation reserves, health level, state scale. The results obtained, as of the time of the study and the optimal step, in the course of interpretation, provide an important indicator of the body's internal reserves, which can be taken into account when prescribing therapy or preventive measures. It is usual for an ART doctor to determine the loads on the body - geopathogenic, electromagnetic, toxic, radioactive, as well as bacterial, mycotic, viral, parasitic and a number of others, which affect the subjective feeling of a person, in other words, his general condition. Recently, along with functional and morphological indicators of the level of health, it has become relevant to determine the mental status of a person. The ART method allows you to solve this urgent problem through testing mental stress, the state of the autonomic nervous system and other indicators. The next step in the examination using the ART method is to determine the morphological changes in organs on the HL and AF scales, the level of anabolism, the state of the immune and endocrine systems. Important in the diagnosis of ART is considered its preventive function, that is, the identification of preclinical changes in organs, which is also taken into account in the conclusion and recommendations at the end of the medical examination. During repeated clinical examination, the dynamics of the state of health is monitored according to the results of segmental diagnostics,

At the medical center using the vegetative resonance test

"IMEDIS-TEST" takes into account the interests of everyone, both the employer, who is interested in the health and social well-being of the employee, and the supervising doctor, who has a complete picture of the functioning of the body, and of course the subject himself. A doctor using ART in such a medical institution is also in an enviable advantage, always comparing the results of his work with the conclusions of an ultrasound scan, an ECG, and extensive laboratory studies.
