

A correctly identified cause of the disease is the key to successful therapy.

N.K. Yakovleva

("Eliseeva Diagnostic Center", Moscow, Russia)

The goal of the doctor is to help the patient solve the problem he came with. There are several options for identifying the root cause of the disease. All variants assume the identification of a key organ, tested according to any index scale that reflects the organism as a whole. Using the most complete picture of the patient's pathology, it is possible through it to find drugs that can cure the patient's body as a whole, that is, we find the key problem, then select the therapy for this problem.

Clinical examples

1. Patient B., 83 years old. Has complained of abdominal pain and liquid stool that bothers you for 6 months. Was examined in various clinics, but there was no lasting improvement. An hour after eating, loose stools, eats often, little, but loose stools remain. On EGDS - erosion of the stomach, bulbit. When diagnosing by the ART method, the most affected organ was identified - the pancreas; violations of the meridians of the small intestine, stomach, pancreas. Helicobacter was found in the stomach and duodenum. In the pancreas - eurythema pancreaticum. In the small intestine - diphylobotrium latum. BRT was performed, a general BR-preparation, preparations BR1, BR2 were made, homeopathic preparations were selected. The stool returned to normal after 3 days, the abdominal pains disappeared. Examination in a month - no complaints of the gastrointestinal tract.

2. Patient, a 5-year-old girl, diagnosed with Thrombocytopenic Purpura. Sick for more than 6 months. The disease began with a temperature of 38 ° C for 4 days. After hitting the wheelchair, a hematoma formed. In the analysis of blood platelets - 10 thousand, eos. - 25%. Was treated by a hematologist. Every 2 weeks a blood test was taken, platelets did not rise above 90-100 thousand. Contact us at the Center. The testing revealed a disturbed meridian of blood circulation and spleen, the most affected organ is the spleen. Acquired toxic information - parasites. Hematobium schistosoma was found in the blood and spleen. BR-preparations have been made, homeopathy has been prescribed. After 2 weeks of treatment: platelets - 124 thousand, eos. - 10%. In a month, platelets - 250 thousand, eos. - 7%. After 2 months: platelets - 250 thousand, eos. - 6%. The girl underwent BRT treatment once a month for 6 months.

Conclusions: using the ART method, you can determine the organ of the lesion and the causes diseases, find drugs that can cure the body.
