

Structural Resonance Therapy (CRT)

T.G. Voloshin

(Federal Medical and Biological Agency of Russia, Moscow, Russia)

Structural resonance therapy (SRT) is a method of treatment and prevention of a number of diseases of inflammatory, dystrophic, post-traumatic genesis and correction of functional conditions. The impact on biologically active zones and points with electromagnetic fields, the parameters of which correspond to the genetically determined natural electromagnetic oscillations of the human body, causes a series of biochemical, energetic, functional changes, both local and general.

Structural resonance therapy allows you to act on different links of pathogenesis and simultaneously carry out electromagnetic therapy for several diseases. At the same time, this technique makes it possible to reduce the dose of drugs when combined with pharmacological therapy, as well as to shorten the duration of treatment, and to optimize the schemes of prevention and rehabilitation.

Knowing the frequency rhythm of the functioning of this or that organ in the norm, it is possible, under pathological conditions, to influence it with an electromagnetic field or a pulse current of a certain frequency and bring its functioning closer to the normal mode, i.e. create optimal conditions for stopping the pathological process.

The author has completed CPT training in Germany. Currently, he is working on the Vegatest-expert apparatus, which has an additional CPT program. According to this program, we first determine the organ with the existing underlying pathology, and how far the organ's condition deviates from the norm. Then, by applying the theory of Wu-Xing, we can determine the weakest organ. If it is not possible to identify a weak organ, it is necessary to look for a pathology in the corresponding meridian.

In more detail, from my own experience: I usually start by determining which primary element has pathology. The primary element is FIRE, it includes Ig-C (small intestine and heart), the primary element EARTH - E-RP (stomach, pancreas and spleen), the primary element WOOD - VB-F (gallbladder, liver), primary element METAL - Gi-P (colon and lungs), primary element WATER - VR (bladder and kidneys). The organ with the greatest pathology was identified. We begin to treat him with the CPT program, the treatment continues for 5 minutes. Further, the electromagnetic low-frequency characteristics of the diseased organ are recorded on a magnetic card (Si CARD). The magnetic card is fixed on the patient's skin and serves for long-term treatment in cases of chronic diseases. Treatment with the CRT program for 5 minutes in almost 100% of cases relieves pain associated with various kinds of colic, spasms, neuralgia, etc. There is experience in the treatment of extremely serious patients in intensive care units. Using magnetic cards in the complex treatment of patients in intensive care, it was possible to significantly reduce the mortality rate.

In the same way, metabolic disorders such as obesity can be treated with an entry on the Si CARD.

The author has treated about 2000 patients with good effect.

In the Scientific Research Institute of the joint venture them. Sklifosovsky Research Institute for Emergency Medicine, 37 patients with sepsis were treated, whose blood was recorded in inversion on the SI CARD.

I recommend the introduction of this method of therapy in Russia.
