Essences",
Graz, Austria)

Introduction

A.F. Bilibin wrote: "When healing, more than one wing should be used (science), and the two wings are science and art. Real healing requires a flap of both wings. "

In recent years, the theory of the systemic organization of the world has become very relevant, and this also applies to a person as a biological system. Scientific knowledge about systems and systemic organization of processes and phenomena of nature, science, technology, functional formations and structures is constantly expanding.

Man is a complex, open, self-regulating and self-reproducing biological system. It is inextricably linked with the surrounding world and is in dynamic balance. A person is then healthy when all his rhythmic processes are in dynamic equilibrium. Imbalance leads to illness.

Modern medicine, with all its tremendous success in eliminating acute conditions, has lost a holistic approach and, accordingly, the ability to cure chronic diseases.

The devices of the IMEDIS Center and the developed diagnostic and therapeutic methods provide a unique opportunity to determine which functional systems are affected by the pathological process, and how to restore the self-regulation mechanism.

Since November 2012, we have been using Rostock Essences in the form of drops and preparations from the Institute of Biosensorics in our office.

Materials and methods

For diagnostics and therapy all the time from the beginning of the work of the office, the APK "IMEDIS-EXPERT", the devices "IMEDIS-BRT-A" and "MINI-EXPERT-T" are used.

Since November 2012, thanks to the kind support and responsiveness of Mrs. Nikola Volgemut, it became possible to successfully use the Rostock Essences in combination with the equipment of the IMEDIS Center. We offer several ways of introducing the Rostock Essences during therapy, which are detailed in the conference reports of the IMEDIS Center. Also, since November 2012, preparations from the Institute of Biosensorics have been used for therapeutic purposes, which have proven their special effect.

Using the equipment of the IMEDIS Center, doctors developed the methodology and supplemented it with new tests. In our work, we build a pathology chain and then a therapy algorithm. A systematic approach to the diagnosis of energy-informational deviations and the construction of a therapy algorithm always gives

the ability to identify the system, organ or structure that is the key issue. Based on the state of integral systems, therapy is defined.

Analyzing the results of the autonomic resonance test (ART) of patients in recent years, we note:

1. An increase in the level of psycho-vegetative stress, anxiety-depressive states with an increase in cortisol, adrenaline and norepinephrine.
2. Increased accumulation in the body of pesticides, herbicides, chemicals and toxic metals.
3. An increase in dysbiosis of the small intestine and a lack of enzymes in 12-duodenum.
4. Increase in the number of allergic and autoimmune diseases. It means that the level of exposure to harmful factors is ahead of the body's ability as a biological system to remove them and adapt.

The purpose of our work is to optimize the algorithm to identify and eliminate the causes that remain hidden during routine testing. A model of the disease is built, which includes the affected organs, tissues, systems, nosodes of the disease. An organ is found that is associated with the onset of the disease.

In cases where the model of the disease gives a pronounced response to psychovegetative loads (PS), vegetative loads (VL) and negative programs (NP), it is not possible to completely eliminate energy-informational and morphological disorders at the moment.

To identify the key points of the body's maladjustment mechanism, the patient writes down in his own words the possible reasons separately, the way he feels them. Patients point out the event, emotion, people, and other possible causes, and do so frankly. The energy of thought and word is designated as a psychological level, a resonance is obtained with certain morphological structures of the brain, which trigger a disharmonious signal. We connect the tested chain in the selector: the model of the disease, PEN, VN and NP, and in the passive electrode we place the record of the reason. We choose the most compensating note or notes and through Cu met. The D400 is tested in inversion. We carry out BRT along all meridians, we connect the selected drugs to the selector.

We always connect to the second or fourth container: Essences "Sprout" and "Globule Sprout" -enzymes, Ampoules E16 / 05, DNA, enzymes and amino acids of the Institute of Biosensorics (Graz, Austria). Our observations indicate that these drugs nourish the body, no energy is wasted to obtain an effect, they are immediately built into the BRT. Therapy takes place without exacerbations, the pathogen is quickly eliminated (more often Cocksackie and Epstein-Barr viruses are found in nerve tissues). Recovery and regeneration are stimulated.

Clinical examples

1. Patient Zh.II., age 9 months. Diagnosis: lissencephaly and pachigiria. V During the first three months after birth, the baby developed normally. After vaccination, convulsive seizures began. The condition worsened, and the child was in the hospital for constant therapy. They were treated with drugs: Sabril, Sinakten, Konvulex, Rivotril, Diazepam without result. Laboratory tests revealed the Epstein-Barr virus, no genetic abnormalities were found. In addition, discharge from the nasopharynx, cough and nasal congestion constantly appeared, the discharge increased after examination in the hospital.

In this situation, the parents turned to a bioenergy therapist, after the session the child's convulsions stopped. Additional examinations and consultations were carried out in a first-class Turkish clinic.

The children's neurologist prescribed therapy for the child: Sabril 2 x 500 mg and Clonarex 1/8 5 mg per day, sessions with an energy therapist and a kinesitherapist continue. Parents turned to our office for diagnosis and treatment.

From the anamnesis: the mother has abnormal pregnancy, placenta previa, bleeding during pregnancy, pituitary adenoma, obesity, allergies, increased blood sugar during pregnancy.

When diagnosed by ART: Epstein-Barr virus and CMV across the placenta were detected. EBV is tested in D15 and D30, CMV is tested in D200. Minimal damage to DNA and chromosomes No. 4, 10 and 12 is tested. The primary affected organ is the motor zone of the GM, the pyloric stomach and the duodenum 12. From the group "Medpharma" tested: white medulla, chronic encephalitis, cerebral atrophy, cerebral edema, right hemisphere, myeloencephalitis. Also a positive test for intoxication, viruses and chemical burden, Campylobacter and Enterobacter were found in the duodenum, Klebsiella and Strept were found in the throat. pneumonia. Chakras 4B and 5A, 6A are closed, vaccine burden is tested.

At the first appointment, the mother and the child were treated with an OBRP, they were assigned to receive silver water, Dr. Schussler's salt No. 3, 4, 8 for isolation and No. 7 for the nervous system. A control test was done every week.

At the second intake we included the Rostock Essences M7, SOM 3, SOM 22, SOM 23, C5, C6, enzymes. Among the preparations of the Institute of Biosensorics (IBBU), the Enzyme ampoule, the DNA ampoule, and the Information ampoule E16 / 05 were included. All preparations were included through the ampoule carousel.

The chakras were unblocked. BRT was performed, PRP was recorded on the brain and PRP on secrets.

At the following appointments, PDUs were made against infectious agents.

A noticeable improvement in the condition is observed in terms of physical and mental development. Specialists dealing with the baby also noted an improvement in the condition. The kid began to sit down, move his arms and legs, grab objects. Teeth began to grow, contrary to the forecast that they would not appear at all! Became

emotional, laughs, navigates, begins to pronounce and repeat simple syllables. Problem Chakra # 5 resonates with the Negative Program. Through it, a note is tested with the reason that my mother suggested. The note is included in the inversion against the background of BRT, which caused a noticeable improvement in the condition of the child and mother.

The work with the child and mother continues.

2. Patient K.E.E., 3.5 years old. Child from the third normally proceeding pregnancy. The girl was not sick, she was developing normally, another daughter and a son, also healthy children, are growing in the family.

Anamnesis: After JVI, swelling of the right knee joint appeared. The examination revealed tests for autoimmune diseases, increased CRP, uveitis.

Diagnosed with juvenile rheumatoid arthritis, oligoarticular type I. For six months the girl was treated with Voltaren, Medrol and Methotrexate without result. Mom decided to switch to a gluten-free diet. The edema remained, and the parents turned to our office for diagnosis and treatment.

When diagnosed by ART: revealed a depletion of the immune system associated with the spleen. Exercise: positive test for vaccination resistance and Streptococcus beta hemolyticus in D15 and D100. From the structures of the joint, organ products are tested synovial membrane D5, D6, D12 and OP the patellar bag D5, D6, D12. Chakras 1B, 4B and 6B are closed. The pathological chain gave a resonant response with an organ preparation of the kidney and the meridian of the lungs and bladder. Radioactive load and negative program detected.

The pathological chain resonated with a certain recorded program, the inversion of which triggered the healing process.

3. Patient V.K., 34 years old. Diagnosis: alopecia totalis. Dermatologists treated cosmetics, vitamins, immunostimulants. No autoimmune process is detected.

At the first appointment with ART diagnostics: a high degree of psychological stress and vegetative burden, lack of trace elements and vitamins, radioactive burden. From the "Medpharma" group of the "Hair" section, those structures that are affected by the balding process have been tested. From organopreparations, the pineal gland, bile ducts and kidneys were tested. We know the emotions associated with these organs. There are problems with the brachial plexus and vascular spasms in the head area. Chakras # 5 and # 6 are closed. In the brachial plexus, Cocksackie, Parainfluenza and Rhinovirus viruses are tested.

The patient was asked to write down the psychoemotional causes that caused the most severe stress. The notes with the reasons connected in inversion made it possible to start chakra therapy, then the elimination of viruses. During antiviral therapy with Cocksackie frequencies, the patient had tingling and creeping sensations in the brachial and lumbar plexus, in the branches of the trigeminal nerve and over the entire surface of the scalp. If the psychoemotional nosode was removed from the inverted container, the patient immediately developed dizziness, tension

in the head, severe pain in the plexus. The connection of Rostok and the Biosensorics Institute preparations to the fourth container of the apparatus greatly improved the condition. After BRT, the patient explained that such a feeling of liberation and joy was felt only after the birth of her son.

At the follow-up appointment: also prescribed a diet, Dr. Schussler's salts, acupuncture. The work with the patient continues.

Received	results	conclusions show	unlimited	possibilities
information medicine.	Center equipment	"IMEDIS"	allows	find root cause
destabilization of the body's control systems.				

Only when the regulatory signal leaves the psychological and event level can the manifestation of the disease at the physical level be eliminated. This systemic approach allows the treatment of diseases recognized as incurable.
