

Clinical cases of relaxation

H. Murakami

(IMC Clinic, Yokohama, Japan)

It is usually difficult to find the reasons for the patient's fatigue and to relax. We focused our attention on assessing the state of the hypothalamus to assess the level of brain stress and to correct the patient's condition.

The EPT programs E4, E10, E11, E331, E362, E743, N843 were used as treatment for 10 minutes. for each with an intensity of exposure of 40 units. The impact was carried out by means of devices for magnetic therapy.

This effect, as a mono-method, made it possible to improve the general health of patients who work 11 hours a day.

Clinical examples

1. Patient A. Male, 48 years old. Initial state Hypothalamus D4 / D12. After Hypothalamus D6 therapy.

2. Patient B. Male, 36 years old. Initial state Hypothalamus D3 / D15. After Hypothalamus D10 therapy.

We find the proposed criteria for assessing the condition and methods of treatment effective for carrying out patient relaxation procedures.
